Your 1-Page Plan

Vizdale Full-Stack Developer Internship

Your Name	
Project	BillDrop
Client	Irumbu Mart, a hardware wholesaler in Salem
Who will use it?	Accountant: uploads, reviews, corrects, and saves bills. Manager: views supplier totals and problem bills.
Your How Might We, in your own words	How might we help a hardware wholesaler check supplier bills faster and catch wrong totals or duplicate bills before payment?
Your tool in one sentence	A web tool that reads supplier bills, lets an accountant verify and save the details, and exports checked records to Excel.

Five things a user can do

#	User action
1	Accountant signs in and uploads a made-up supplier bill.
2	The tool reads bill text and suggests supplier, bill number, date, line items, and total.
3	Accountant reviews the bill beside the extracted fields and corrects mistakes.
4	The tool flags a wrong total or duplicate; accountant confirms and saves clean records.
5	Accountant exports bill records to Excel; manager views supplier totals and problem bills.

Your AI feature	AI extracts bill details for review, then drafts a polite message when the total is wrong. The accountant checks and copies it. If AI fails, show editable text; never save unreviewed results.
Main screens	Accountant: Upload, live progress cards, bill review, supplier totals. Manager: read-only supplier totals and problem bills.
Made-up data you will use	Invented suppliers, accounts, and one-page printed sample bills only. No real customer or supplier data.
What worries you most?	OCR and AI can misread a bill or hit free-service limits. Keep human review required; test with small synthetic bills first.
